Claims

What is claimed is:

1. The method of determining the level of structural coverage of RBT test cases, which are written for a program that does not provide for structural coverage testing,

5 comprising the steps of:

providing RBT test cases with associated inputs and outputs;

providing a structural coverage test tool;

converting said inputs and outputs to acceptable formats for said coverage test tool;

10 supplying such converted inputs and outputs to said coverage test tool; and

operating said coverage test tool;

thereby to determine the level of structural coverage of such converted RBT test cases.

2. The method as set forth in claim 1 wherein said RBT test cases are written to

15 verify or validate target code.

3. The method as set forth in claim 1 wherein said structural coverage test tool is IBM Rational Test RealTime.

4. The method as set forth in claim 1 wherein said inputs and outputs are provided to an Excel® spreadsheet.
